U.S. EGG INDUSTRY STATISTICAL REPORT SUMMARY

* The March hatch (straight-run chicks) was 4.0% higher than in 2015. This projects forward to a 23.6 million pullet placement for August of 2016 which is 2.1 million larger than August of 2015 placement (21.5).

* Current (March average, 2016) U.S. table egg layer number (302.4 million) is 5.6 million smaller than last year's number at this time (308.1 million), and up 3.9 million compared to last month (298.6 million).

* In March, Iowa led the nation with 46.5 million laying hens compared to 32.0 million in Ohio, 29.2 million in Indiana, and 25.6 million in Pennsylvania. California (with 11.8 million layers) lost it's 5th position to Texas with 16.4 million layers.

* The March U.S. rate of lay was estimated to be 78.5% which is 0.2% lower than March 2015 level. The total number of table eggs produced in March 2016 was 2.1% lower than the March 2015 production.

* The March 2016 number of eggs exported was 29% lower than last year (March 2015) and 52% higher than last month (February 2016). The March exports represented 3.4% of the number of eggs produced.

* Shell eggs broken for products in March 2016 totaled 6.275 million cases, 4.1% more than in March 2015 (6.030 million cases).

* The egg-type hatchery supply flock is projected to be 12% higher in Jan-Sep 2016 than in Jan-Sep 2015 (table 16).

SPECIAL NOTE:

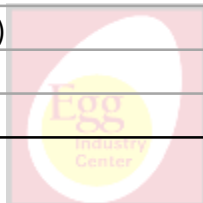

In March the U.S. produced 5.0 million less eggs per day than in March 2015. However, we exported 3.4 million less eggs per day and imported 6.1 million more eggs per day than in March 2015. The result of these three forces is an increase of 4.4 million eggs per day with respect to March 2015. The initial March inventory was not able to offset this additional 4.4 million eggs/day. Please see "The market reaction after the high path avian influenza outbreak of 2015" special report:

Note: The number of pullets to be housed was reduced by 6 million based on the number reported as lost to avian influenza. We assumed the reduction as evenly spread during the period between May and September 2015 (assuming that the ages of affected birds was evenly distributed).

Source: Egg Industry Center based on USDA NASS Chickens and Eggs data

Note: The number of layers younger than 72 weeks of age are estimated as the sum of the Egg-Type Chicks Hatched between 5 and 17 months before adjusted by a 9% loss

* Special note: A special adjustment to this calculation will be needed as a result of the avian influenza outbreak, but it will depend on some assumptions about the ages of the layers affected.

FLOCK SIZE PROJECTION

The U.S. flock size is projected for the current year and the following year for each month. Projections start with the first of the month official USDA count and are then adjusted monthly. Adjustments are made considering the most recent:

1. Hatch data (projected 5-months into the future with mortality). Subsequent hatches are based upon 6-year percentage trends for each month.
2. USDA slaughter data and estimates based upon 6-year trends for subsequent months.
3. Missing estimates are included for on-farm slaughter, died, exports, etc. This data is expressed as a percentage of each month's beginning count based upon recent history.

Project. Year end:						Dec, 2016 - 320.5					

The avian influenza outbreak created a large reduction on the U.S. flock; therefore, we expect our flock projections to be a lot less accurate than normal until the situation stabilizes. To be able to approximate a projection we assumed that:

- the age of the 6 million pullets lost to AI were evenly distributed
- the percent of the flock culled (slaughter, died or missing) by month stays the same
- producers find a place where to house the pullets grown (based on the 5 month before hatch)
